

# Predicting Falcon 9 First Stage Landing Success

Shahram Hakimi  
August 26, 2023

## OUTLINE

- **Executive Summary**
- **Introduction**
- **Methodology Data collection**
- **Data wrangling**
- **EDA and interactive visual analytics**
- **Predictive analysis**
- **Results EDA with visualization**
- **EDA with SQL**
- **Interactive map with FOLIUM**
- **Plotly Dash Dashboard**
- **Predictive analysis (classification)**
- **Conclusion**
- **Appendix**

## Summary of Methodologies

The research aims to identify the crucial factors contributing to a successful rocket landing. To achieve this goal, the study employs the following methodologies:

### 1.Data Collection:

Utilization of SpaceX REST API and web scraping techniques for data gathering.

### 2.Data Wrangling:

Transformation of collected data to establish a success/failure outcome variable.

### 3.Data Exploration:

Application of data visualization techniques to explore various factors, including payload, launch site, flight number, and yearly trends.

### 4.Data Analysis:

Employment of SQL for data analysis, involving calculations of statistics such as total payload, payload range for successful launches, and total count of successful and failed outcomes.

### 5.Launch Site Investigation:

Exploration of launch site success rates and their proximity to significant geographical markers.

### 6.Launch Site Visualization:

Visualization of launch sites with the highest success rates and successful payload ranges.

### 7.Predictive Modeling:

Construction of models for predicting landing outcomes, incorporating logistic regression, support vector machine, decision tree, and K nearest neighbor algorithms.

## Results

### Exploratory Data Analysis:

- Observable enhancement in launch success rates over time.
- KSC LC 39A emerges as the most successful landing site.
- Orbits E S L1, GEO, HEO, and SSO exhibit a flawless 100% success rate.

### Visualization/Analytics:

- Majority of launch sites are located near the equator, with all sites positioned close to coastlines.

### Predictive Analytics:

- All models demonstrate comparable performance on the test set.

.

# INTRODUCTION

The commercial space age is democratizing space travel through companies like Virgin Galactic, Rocket Lab, Blue Origin, and notably SpaceX. Each offers unique services, from suborbital flights to satellite launches. SpaceX stands out with achievements like ISS missions, Starlink internet, and crewed spaceflights. Their cost advantage lies in reusing the first rocket stage, unlike others that are much more expensive. Forest Katsch's diagrams illustrate the significance of the first stage in Falcon 9 rockets, which is pivotal for the launch. Goal of this research is by gathering SpaceX data, building dashboards, and analyzing data, predict the first stage reuse using machine learning. This is in the pursuit of challenging SpaceX in the rocket industry.

# METHODOLOGY

**1.Exploring SpaceX Launch Data Using specifically the SpaceX REST API and Web Scraping**

**2.Wrangling data by cleaning, transforming, and organizing raw data into a structured and usable format for analysis.**

**3. One Hot Encoding and Data Cleaning:** This involves preparing the data for machine learning by transforming categorical variables through one-hot encoding and addressing missing or irrelevant data.

**4. Exploratory Data Analysis (EDA):** Using both visualization techniques and SQL queries to understand and gain insights from the dataset's structure and patterns.

**1.Interactive Visual Analytics with Folium and Plotly Dash:** Utilizing tools like Folium and Plotly Dash to create interactive visualizations that enhance data understanding.

**2.Predictive Analysis with Classification Models:** Employing classification algorithms to predict outcomes based on input features.

**3.Building and Evaluating Classification Models:** Developing models such as Logistic Regression (LR), k-Nearest Neighbors (KNN), Support Vector Machines (SVM), and Decision Trees (DT), then evaluating their performance to identify the best model.

- **DataCollection by : API**

- Obtain the response and decode it using the appropriate method. Convert the decoded data into a dataframe using the .json\_ function.
- Use custom functions to request specific information about the launches from the SpaceX API.
- Generate a dictionary from the obtained data.
- Create a dataframe using the generated dictionary.
- Apply a filter to the dataframe to include only launches associated with the Falcon 9 rocket.
- Fill in any missing values in the Payload Mass column using a calculated method.
- Export the processed data to a CSV file.

# SpaceX REST API

## SpaceX REST API

Open Source REST API for launch, rocket, core, capsule, starlink, launchpad, and landing pad data.

Build 1.0.0 Docker pull 2.1M Issues 14.5K License MIT

We are not affiliated, associated, authorized, endorsed by, or in any way officially connected with Space Exploration Technologies Corp (SpaceX), or any of its subsidiaries or its affiliates. # Steps for getting Data by Web Scrapping

- Retrieve Falcon 9 launch data from Wikipedia.
- Generate a BeautifulSoup object from the HTML response.
- Extract column names from the header of the HTML table.
- Gather data by parsing HTML tables.
- Construct a dictionary from the collected data.
- Generate a dataframe using the created dictionary.
- Export the data to a CSV file.

2020 [ edit ]

In late 2019, *Carynne Shover* stated that SpaceX hoped for as many as 24 launches for Starlink satellites in 2020,<sup>[*link*]</sup> in addition to 14 or 15 non-Starlink launches. At 20 launches, 13 of which for Starlink satellites, Falcon 9 had its most prolific year, and Falcon 9 were second most prolific rocket family of 2020, only behind China's *Long March* rocket family.<sup>[*link*]</sup>

Flight No.	Date and time (UTC)	Version, Booster <sup>[1]</sup>	Launch site	Payload <sup>[1]</sup>	Payload mass	Orbit	Customer	Launch outcome	Booster landing
16	7 January 2020, 08:10:01 <sup>[11]</sup>	F9 B5 Δ, B1044.4	CCAFS, SLC-40	Starlink 2 v1.0 (20 satellites)	15,800 kg (34,800 lb) <sup>[1]</sup>	LEO	SpaceX	Success	Success (down stage)
Third large launch and second operational flight of Starlink constellation. One of the 60 satellites included a test coating to make the satellite less reflective, and thus less likely to interfere with ground-based astronomical observations. <sup>[111]</sup>									
17	14 January 2020, 19:20 <sup>[112]</sup>	F9 B5 Δ, B1044.4	KSC, SLC-38A	Crew Dragon in-flight abort test <sup>[113]</sup> (Dragon C205.1)	12,200 kg (26,900 lb)	Sub-orbital <sup>[114]</sup>	NASA (CRS) <sup>[115]</sup>	Success	No attempt
An atmospheric test of the Dragon 2 abort system after Max Q. The capsule fired its SuperDraco engines, reached an apogee of 40 km (25 mi), deployed parachutes after reentry, and <i>splashed down</i> in the ocean 31 km (19 mi) downrange from the launch site. The test was previously slated to be accomplished with the <i>Crew Dragon Demo-1</i> capsule, <sup>[116]</sup> but that test article exploded during a ground test of SuperDraco engines on 22 April 2019. <sup>[117]</sup> The abort test used the capsule originally intended for the <i>Orion</i> flight <sup>[118]</sup> as expected, the booster was destroyed by aerodynamic forces after the capsule started. <sup>[119]</sup> First flight of a Falcon 9 with only one functional stage — the second stage had a <i>mass simulator</i> in place of its engine.									
18	29 January 2020, 14:23 <sup>[120]</sup>	F9 B5 Δ, B1051.3	CCAFS, SLC-40	Starlink 3 v1.0 (20 satellites)	15,800 kg (34,800 lb) <sup>[1]</sup>	LEO	SpaceX	Success	Success (down stage)
Third operational east-bound batch of Starlink satellites, deployed in a circular 290 km (180 mi) orbit. One of the falling Falcon was caught, while the other was <i>fished out of the ocean</i> . <sup>[121]</sup>									
19	17 February 2020, 18:05 <sup>[122]</sup>	F9 B5 Δ, B1054.4	CCAFS, SLC-40	Starlink 4 v1.0 (20 satellites)	15,800 kg (34,800 lb) <sup>[1]</sup>	LEO	SpaceX	Success	Falure (down stage)
Fourth operational and 10th large batch of Starlink, launched. Used a new flight profile which deployed into a 210 km x 366 km (130 mi x 228 mi) elliptical orbit instead of descending into a denser orbit and firing the second stage engine twice. The first stage booster failed by <i>lost on the down drop</i> <sup>[123]</sup> due to incorrect wind data. <sup>[124]</sup> This was the first time a flight proven booster failed to land.									
20	7 March 2020, 09:42 <sup>[125]</sup>	F9 B4 Δ, B1059.2	CCAFS, SLC-40	SpaceX CRS-19 (Dragon C12.3-Δ)	1,377 kg (3,036 lb) <sup>[126]</sup>	LEO (ISS)	NASA (CRS)	Success	Success (grounded)
Last launch of phase 1 of the CRS contract. Carried (discontinued) an ESA payload for testing <i>exterior payloads</i> into ISS. <sup>[127]</sup> Originally scheduled to launch on 2 March 2020, the launch date was pushed back due to a second stage engine failure. SpaceX decided to scrap out the second stage instead of replacing the faulty part, <sup>[128]</sup> it was SpaceX's 80th successful landing of a first stage booster, the third flight of the Dragon C12 and the last launch of the cargo Dragon spacecraft.									
21	14 March 2020, 12:10 <sup>[129]</sup>	F9 B4 Δ, B1044.5	KSC, SLC-38A	Starlink 5 v1.0 (20 satellites)	15,800 kg (34,800 lb) <sup>[1]</sup>	LEO	SpaceX	Success	Falure (down stage)
Fifth operational batch of Starlink satellites. It was the first time a first stage booster flew for a fifth time and the second time the savings were reused (Starlink flight in May 2018). <sup>[131]</sup> Towards the end of the first stage burn, the booster suffered premature shut down of an engine, the first of a <i>Merlin 1D</i> variant and first since the CRS-1 mission in October 2012. However, the payload still reached the targeted orbit. <sup>[132]</sup> This was the second Starlink launch booster landing failure to a date, later revealed to be caused by residual clearing fluid trapped inside a <i>nozzle</i> . <sup>[133]</sup>									
22	28 April 2020, 19:00 <sup>[134]</sup>	F9 B5 Δ, B1051.5	KSC, SLC-38A	Starlink 6 v1.0 (20 satellites)	15,800 kg (34,800 lb) <sup>[1]</sup>	LEO	SpaceX	Success	Success (down stage)

# Data Wrangling

I performed some Exploratory Data Analysis (EDA) to find some patterns in the data and determine what would be the label for training supervised models.

Also defined “Class” Column to convert outcomes into Training Labels with '1' means the booster successfully landed '0' means it was unsuccessful

Then export data as a CSV file

```

# EDA WITH DATA VISUALIZATION

1. We first started by using scatter graph to find the relationship between the attributes such as between:

- Payload and Flight Number.
- Flight Number and Launch Site.
- Payload and Launch Site.
- Flight Number and Orbit Type.
- Payload and Orbit Type.

and find relationship by using bar charts between Class types( successful =Placed, unsuccessful =Unplaced)  
orbit and Launchsite

Distribution of Launchsite by Placement Status

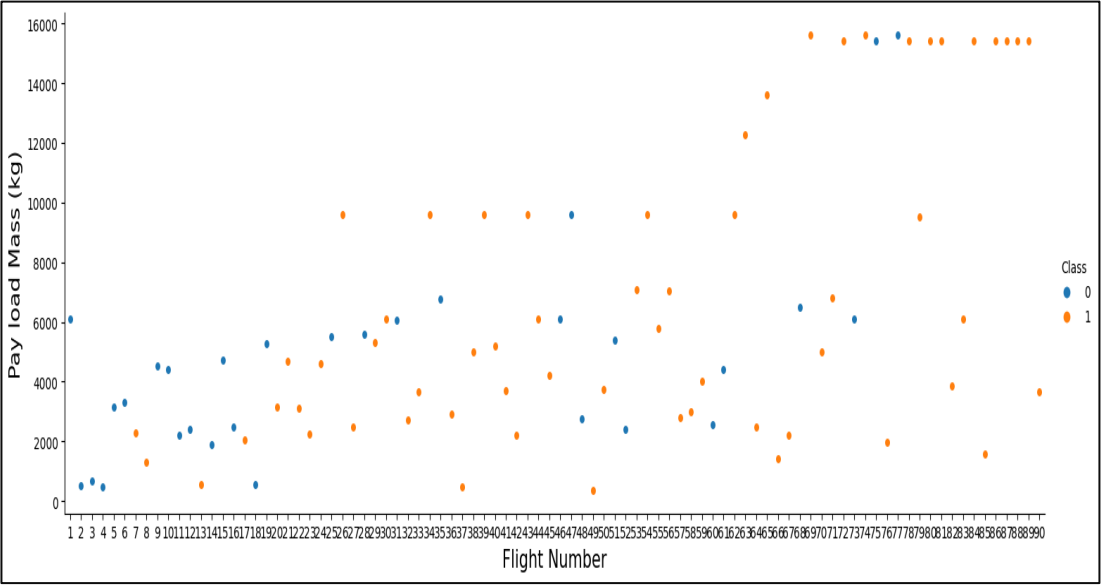

LaunchSite	Placed	Unplaced
CCAFS SLC 40	33	22
KSC LC 39A	17	5
VAFB SLC 4E	10	3

Distribution of Orbit by result

Orbit	Placed	Unplaced
ES-L1	1	0
GEO	1	0
GTO	14	13
HEO	1	0
ISS	13	8
LEO	5	2
MEO	2	1
PO	6	3
SO	0	1
SSO	5	0
VLEO	12	2

# EDA WITH SQL

## SQL queries performed include:-

Displaying the names of the launch sites.

**CCAFS LC-40**  
**VAFB SLC-4E**  
**KSC LC-39A**  
**CCAFS SLC-40**

- Displaying the total payload mass carried by the booster launched by NASA (CRS).

**45596 kg**

- Displaying the average payload mass carried by booster version F9 v1.1.

**2928.4**

-

# EDA with SQL

Listing the date when the first successful landing outcome in the ground pad was achieved.

**First\_Successful\_Landing\_On\_Ground\_Pad**  
**2015-12-22**

- List the names of the boosters which have success in drone ships and have payload mass greater than 4000 but less than 6000.

**F9 FT B1022**

**F9 FT B1026**

**F9 FT B1021.2**

**F9 FT B1031.2**

- Listing the total number of successful and failed mission outcomes.

**Failure (in flight) 1**

**Success 98**

**Success 1**

**Success (payload status unclear) 1**

# EDA with SQL

- Listing the names of the booster\_versions which have carried the maximum payload mass.

**F9 B5 B1048.4**

**F9 B5 B1049.4**

**F9 B5 B1051.3**

**F9 B5 B1056.**

**F9 B5 B1048.5**

**F9 B5 B1051.4**

**F9 B5 B1049.5**

**F9 B5 B1060.2**

**F9 B5 B1058.3**

**F9 B5 B1051.6**

**F9 B5 B1060.3**

**F9 B5 B1049.7**

- Listing the failed landing\_outcomes in drone ship, their booster versions, and launch site names for the year 2015.

**October  
April**

**Failure (drone ship)  
Failure (drone ship)**

**F9 v1.1 B1012  
F9 v1.1 B1015**

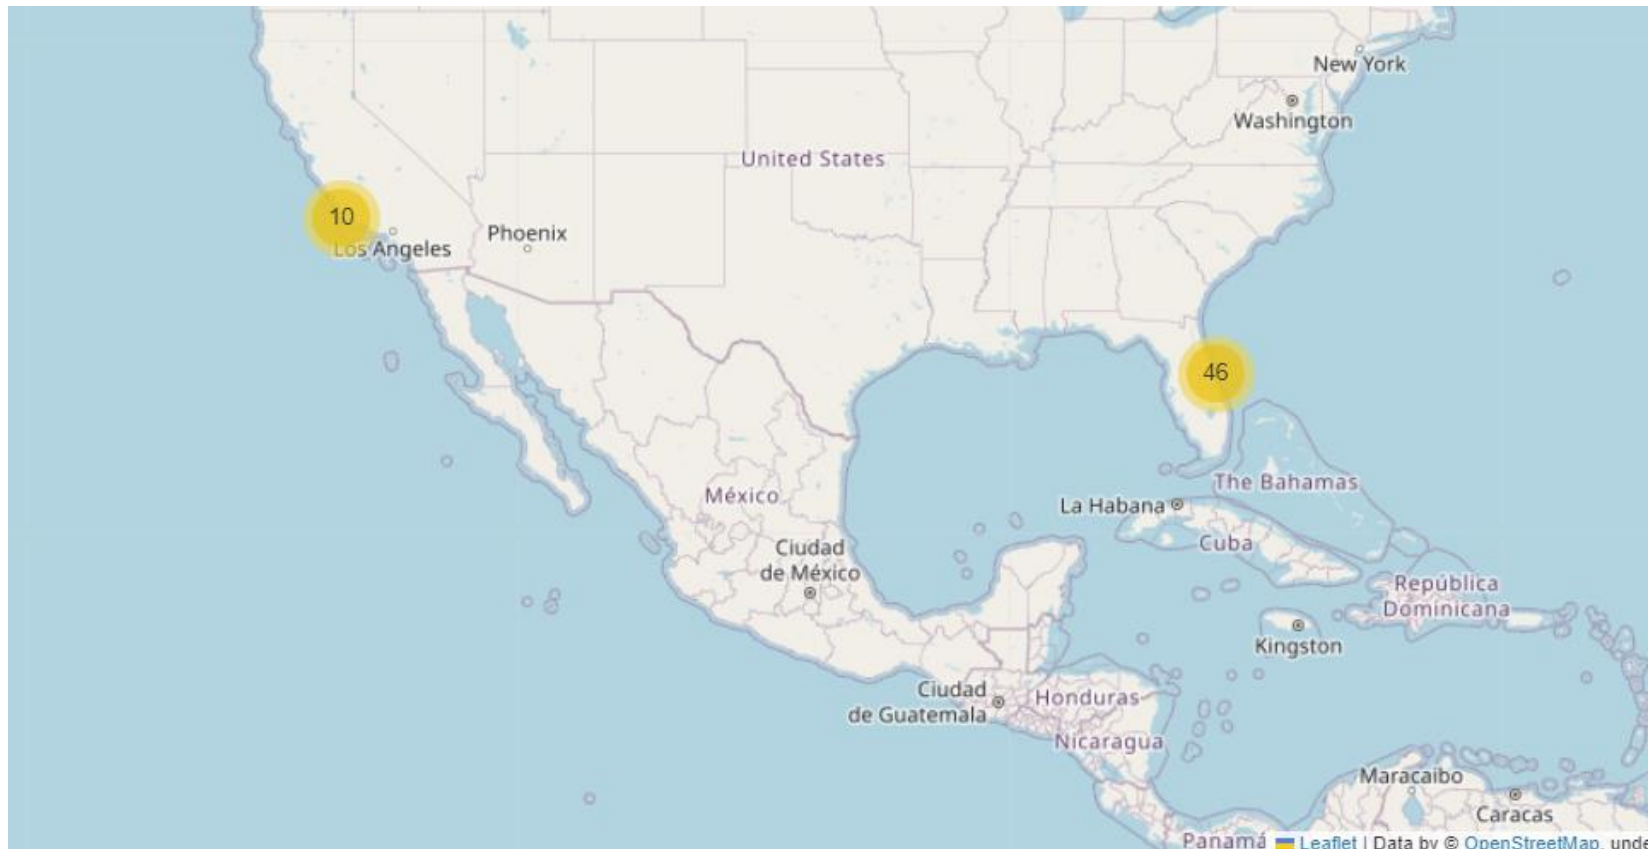

**CCAFS LC-40  
CCAFS LC-40**

- Rank the count of landing outcomes or success between the dates 2010-06-04 and 2017-03-20, in descending order.

No attempt	10
Success (ground pad)	5
Success (drone ship)	5
Failure (drone ship)	5
Controlled (ocean)	3
Uncontrolled (ocean)	2
Precluded (drone ship)	1
Failure (parachute)	1

# Build an Interactive Map with Folium

Marking the success/failed launches for each site on the map

# INTERACTIVE MAP WITH FOLIUM RESULTS

Marking the success/failed launches for each site on the map

VAFB SLC-4E

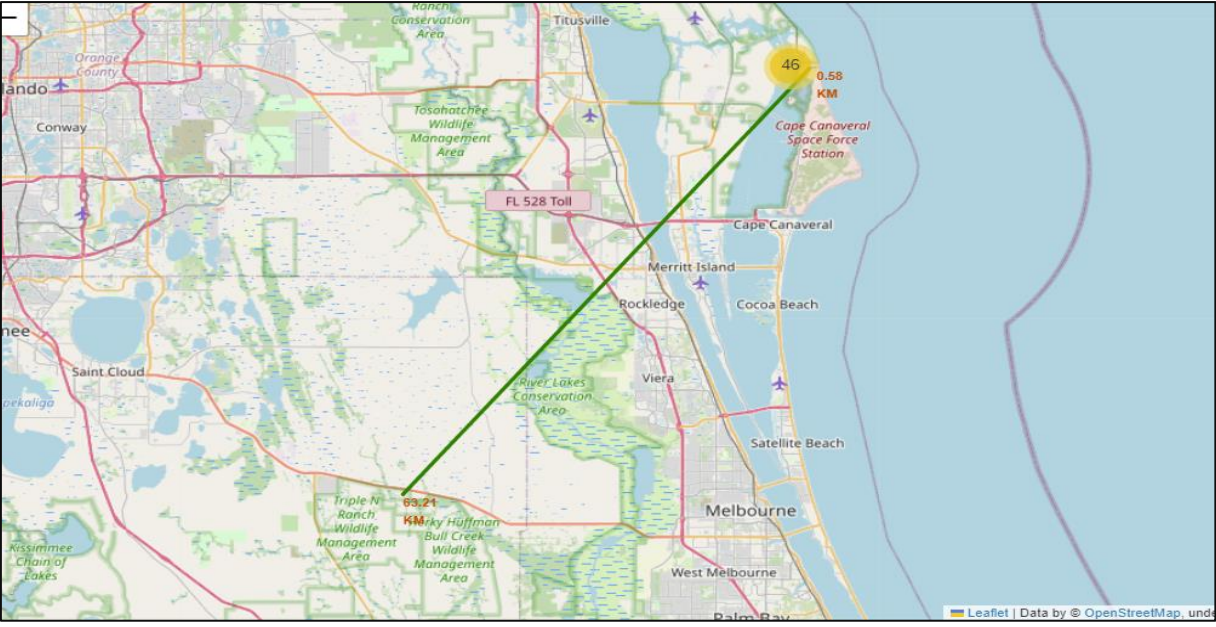

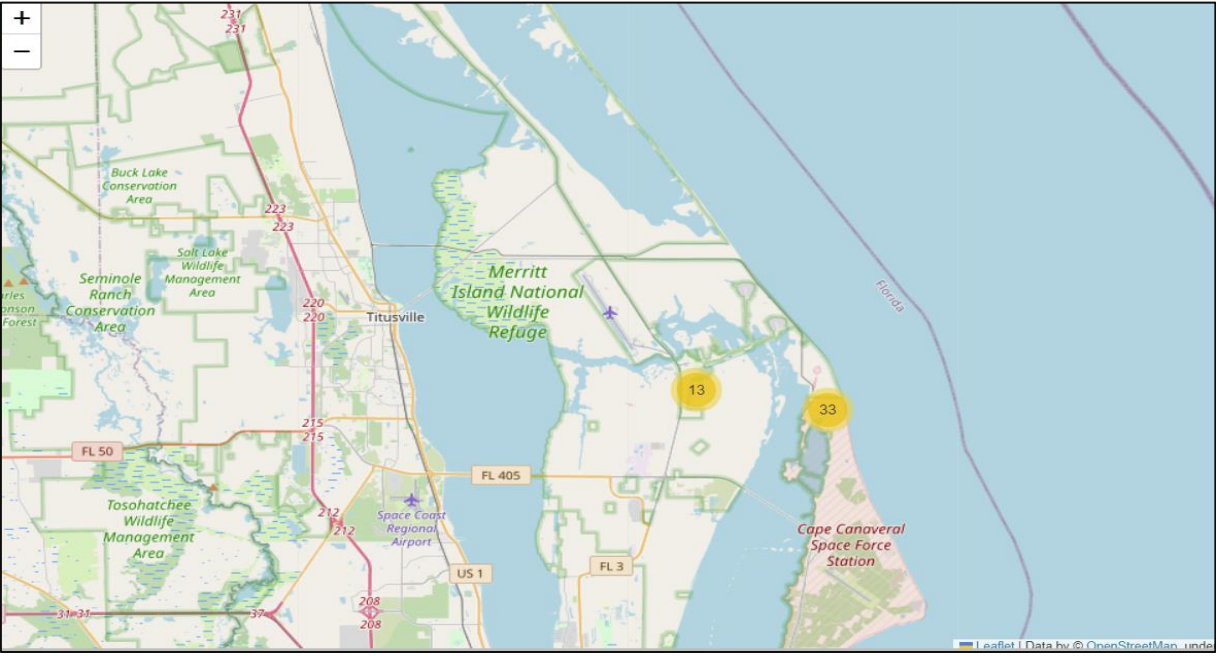

KSC LC-39A

CCAFS LC-40, CCAFS SLC-40

- **Outcomes:**
- **Green** markers for successful launches
- **Red** markers for unsuccessful launches
- Launch site **CCAFS SLC-40** has a **3/7 success rate (42.9%)**

## **Calculating the proximity of each site to a coastline, railway, highway and city**

The closest launch sites to a coastline are: CCAFS LC-40 and CCAFS SLC-40

All launch sites have an average proximity to a railway of 1,15 km

VAFB SLC-4E have a longest distance to a highway (8,85 km)

The launch sites farthest from city are: CCAFS LC-40, CCAFS SLC-40 and KSC LC-39A with a distance of 51,5 km. VAFB SLC-4E is closer to a city with 12,6 km.

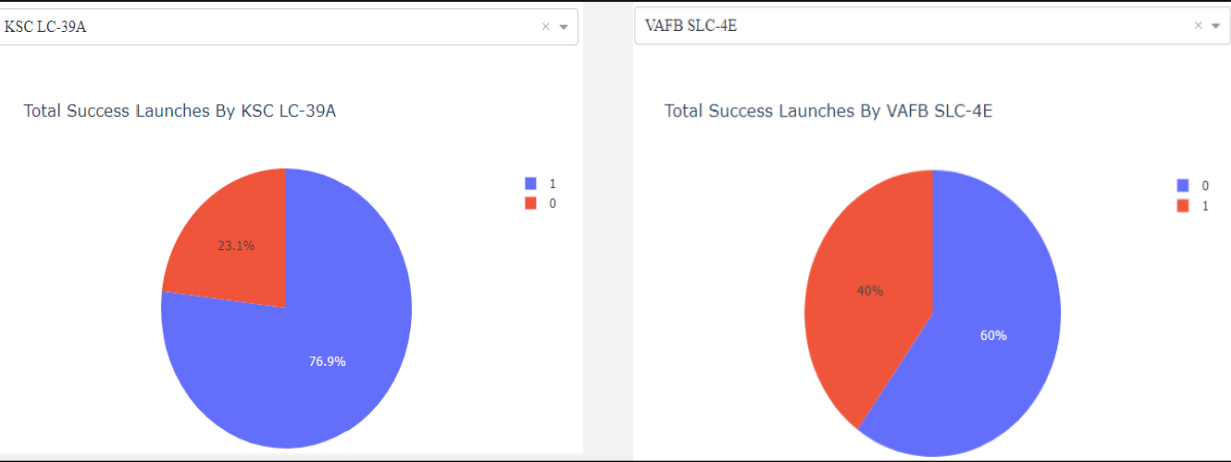

KSC LC 39A had the most successful launches of any sites.

# PLOTLY DASH DASHBOARD RESULTS

# SpaceX Launch Records Dashboard

Payload range (Kg):

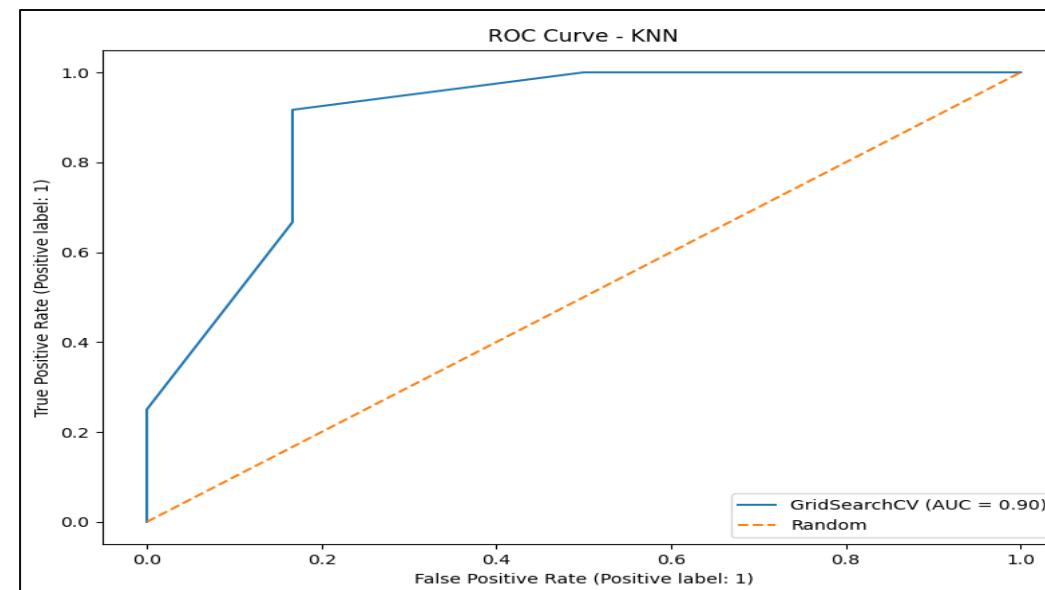

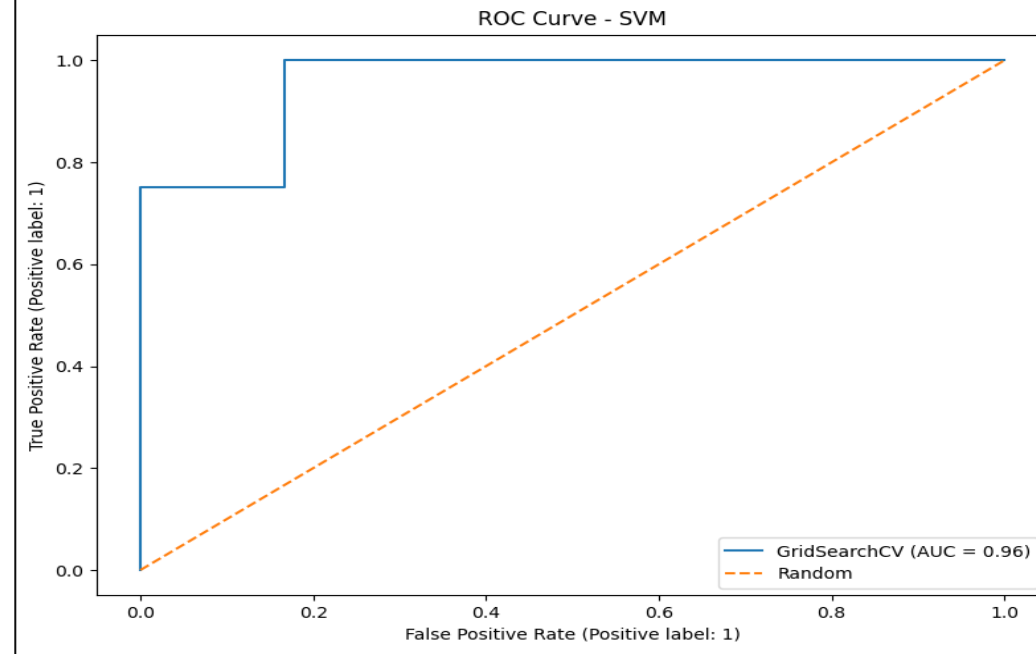

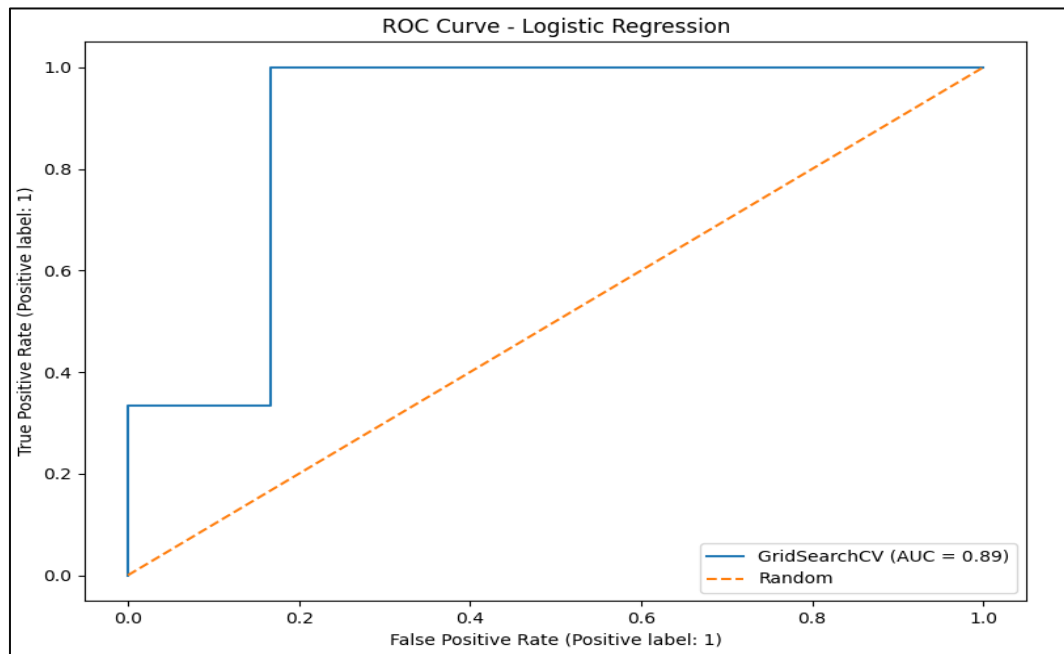

Correlation between Payload and Success for all Sites

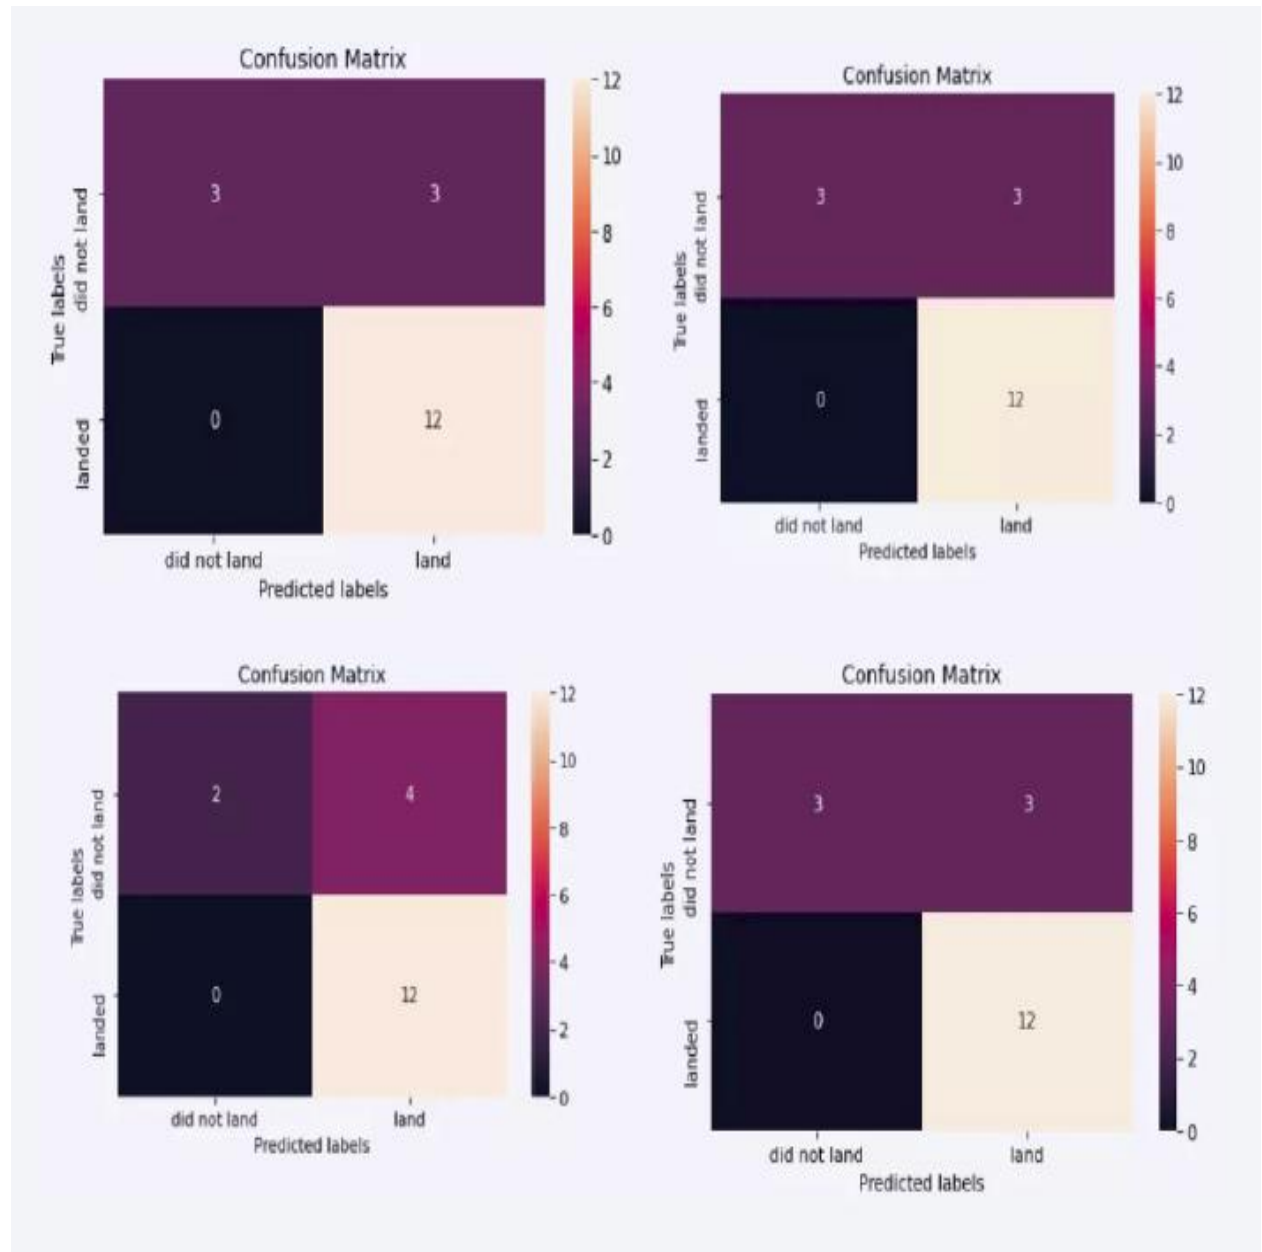

# MACHINE LEARNING PREDICTION

# CONFUSION MATRIX

- The accuracy of knn\_cv = 0.8333333333333334
- The accuracy of decision tree\_cv = 0.8333333333333334
- The accuracy of SVM= 0.8333333333333334
- The accuracy of Logistic Regression= 0.8333333333333334

### **Accuracy**

All the models achieved similar performance with equivalent scores and precision. This uniformity in results is probably because of the limited dataset. Among the models, the Decision Tree slightly outperformed the others, especially when considering the best score.

# CONCLUSION

- 1.The SVM, KNN, and Logistic Regression models have superior predictive accuracy on this dataset.
- 2.Payloads with lower weights outperform their heavier counterparts.
- 3.The rate of success in SpaceX launches increases in direct proportion to the number of years taken to refine the launches.
- 4.Among all the sites, KSC LC 39A recorded the highest number of successful launches.
- 5.The Orbit categories GEO, HEO, SSO, and ES L1 demonstrate the highest rate of success.
